

▯ SECURE PRIDE

Grant Application — Supporting Materials Package

securepride.org | hello@securepride.org | +1 919-667-6994

Prepared: March 1, 2026 | Version 2.0

About This Document

This comprehensive supporting materials package provides grant reviewers with detailed evidence of Secure Pride's technical capabilities, organizational design, team qualifications, and alignment with accessibility-first, community-centered cybersecurity practices. All project code is open-source and publicly verifiable at github.com/Secure-Pride.

TABLE OF CONTENTS

 6. [Design Philosophy: Mindful Development](#)
-

1. ORGANIZATIONAL OVERVIEW

Mission

Secure Pride is an open-source, AI-native cybersecurity nonprofit delivering security infrastructure, tooling, and training specifically designed for LGBTQ+ organizations and other at-risk civil society groups. Our mission is to make cybersecurity **accessible, affordable, and manageable** for communities that need it most — particularly small organizations with limited IT staff, high volunteer turnover, and elevated threat exposure.

Core Values

▮ **Accessibility First**

Every tool, interface, and documentation artifact is designed with neurodivergent users in mind. We prioritize ADHD-friendly output formatting, plain-language explanations, screen-reader compatibility, and reduced cognitive load at every interaction point.

▮▮ **Community-Centered**

Our leadership, design process, and threat modeling are led by members of the communities we serve. We build with lived experience, not assumptions.

▮ **Open by Default**

All code, frameworks, and research are published openly under permissive licenses (MIT, CC BY 4.0). Community safety should never be gated behind paywalls or proprietary systems.

▮ **Privacy-Hardened**

We operate under a zero-trust, privacy-by-default architecture. No analytics tracking, no telemetry, no data brokerage. Community data stays in community hands.

Threat Landscape Context

The populations served by Secure Pride operate in a **heightened-risk threat environment**:

- LGBTQ+ organizations face targeted harassment, doxxing, swatting, and coordinated data breach attacks

- Many operate with **zero dedicated IT staff** and annual security budgets under \$5,000
- AI-generated phishing, deepfake campaigns, and synthetic media increasingly target civil society groups
- Geographic data exposure (member locations, event venues, health records) carries **physical safety risk**
- Marginalized communities are disproportionately impacted by surveillance capitalism and government overreach

Secure Pride addresses these threats with tools explicitly designed for **distracted, under-resourced teams** who need cybersecurity to be **low-friction, automated, and trustworthy**.

2. OPEN SOURCE PROJECT PORTFOLIO

All Secure Pride projects are publicly maintained on GitHub under permissive open-source licenses. Live repository statistics are available at github.com/Secure-Pride and github.com/mazze93.

Project 1 — Secure Pride Cyber-Defense Audit Suite

Repository: github.com/Secure-Pride

Language(s): Python 3.11+, JavaScript/TypeScript

License: MIT (open source)

Status: Active development

Description

A modular, CLI-first security audit framework tailored to the operational reality of under-resourced nonprofit organizations. The suite automates common security assessment tasks including:

- Network exposure scanning and open port enumeration
- DNS hardening verification (DNSSEC, SPF, DKIM, DMARC)
- TLS/SSL certificate validation and cipher suite auditing

- Exposed credential detection and secrets scanning
- Privacy policy compliance checklist generation (aligned to Stonewall Standard)

Design Principles (Accessibility-First Architecture)

ADHD-Friendly Output Formatting

Terminal output uses color-coded severity indicators **with text labels** (not color-only), structured tables with clear visual hierarchy, and progressive disclosure (summary first, details on demand). Output is designed to minimize cognitive overwhelm during high-stress incident response.

Screen-Reader Compatibility

All CLI tools support a `--accessible` flag that strips ANSI color codes and uses plain-text formatting optimized for screen readers. Critical alerts use auditory cues (system bell) in addition to visual indicators.

Non-Destructive by Default

All scans are passive/read-only unless explicitly elevated with confirmation prompts. This reduces decision fatigue and prevents accidental misconfigurations during distracted usage.

Plain-Language Error Messages

Error states explain **what happened, why it matters, and what to do next** in conversational language — not technical jargon. Example: "Couldn't reach your server. Check if your WiFi is connected, then try again."

Technical Highlights

- **Modular plugin architecture** allows community contributors to add new audit modules without touching core code
 - **YAML-based configuration** for repeatable, version-controlled audit profiles
 - **Output exportable to JSON, Markdown, and PDF** report formats
 - **Docker container available** for isolated execution in air-gapped environments
-

Project 2 — Stonewall Standard Data Processing Agreement (DPA) Framework

Repository: [github.com/Secure-Pride](https://github.com/Secure-Pride/docs/stonewall-standard) (docs/stonewall-standard)

Format: Markdown + LaTeX + PDF

License: Creative Commons CC BY 4.0

Status: v1.0 published, v1.1 in development

Description

A reusable, open data governance framework designed specifically for LGBTQ+ nonprofit organizations handling sensitive community data. The Stonewall Standard DPA provides:

- **16-section comprehensive data processing agreement template**
- **Plain-language summaries alongside legal text** (dual-format for accessibility)
- **Guidance for AI/LLM vendor onboarding** and data handling agreements
- **Community-safe data classification tiers** (including gender identity, health records, immigration status)
- **Incident response notification templates** and breach escalation procedures

Accessibility & Usability Features

Dual-Language Format

Every section includes both formal legal language and a plain-English summary written at a 9th-grade reading level. This ensures accessibility for volunteer coordinators and non-legal staff.

Interactive Checklist Version

A fillable PDF with checkboxes, dropdown menus, and guided prompts reduces the cognitive burden of completing a 16-section legal document.

Community-Sourced Glossary

Terms like "data processor," "lawful basis," and "pseudonymization"

are defined in a separate glossary using examples relevant to LGBTQ+ nonprofit operations.

Intended Use

The framework is published freely for adoption by any nonprofit, vendor, or community organization seeking responsible data governance language without access to expensive legal counsel.

Project 3 — AI-Native Threat Toolkit

Repository: github.com/Secure-Pride (branch: ai-toolkit)

Language(s): Python, Node.js

Status: Active development — pre-release (target: Q2 2026)

Description

A toolkit addressing AI-specific threat vectors increasingly targeting civil society organizations, including prompt injection in LLM-integrated workflows, model output poisoning detection, and AI-assisted phishing identification. Core modules include:

- **LLM output integrity checker** for nonprofits using AI assistants
- **Prompt injection detection patterns** for web-integrated AI tools
- **AI-assisted phishing content classifier** (fine-tuned on civil society threat data)
- **Threat intelligence briefing generator** using open-source threat feeds

Neurodivergent-Friendly Design

Threshold-Based Alerts

Risk scores use a three-tier system (Low / Medium / High) instead of numeric scales. Each tier includes **specific recommended actions** rather than abstract risk assessments.

Batched Notifications

Instead of real-time alerts (which create notification fatigue), the toolkit sends daily/weekly digest summaries with prioritized threats

at the top. Users can opt into immediate alerts only for High-severity events.

Visual Threat Dashboards

Web-based dashboard uses color + shape + text labels to convey threat status, ensuring information is accessible to users with color blindness or visual processing differences.

3. TECHNICAL ARCHITECTURE

System Architecture Overview

Secure Pride's technical infrastructure is designed around four core principles:
privacy-by-default, zero-trust access, open-source transparency, and resilience for under-resourced operators.

Platform Architecture Diagram

Frontend & Web Infrastructure

Component	Technology	Purpose
Static Site Generator	Astro	Performance-first, SEO-optimized public site
CSS Framework	Tailwind CSS	Accessible, consistent design system
Interactive Components	React (islands)	Minimal JS, progressive enhancement
CDN & Edge Network	Cloudflare Pages	Global distribution, DDoS protection
DNS Security	Cloudflare (DNSSEC)	DNS hijacking prevention
SSL/TLS	Cloudflare (TLS 1.3 + HSTS)	Encrypted transit
Web Application Firewall	Cloudflare WAF	SQL injection, XSS, bot protection

Table 1: Frontend infrastructure stack

Backend & Tool Infrastructure

Component	Technology	Purpose
Audit Tool Engine	Python 3.11+	Core scanning and assessment logic
CLI Interface	Python (Click)	Cross-platform terminal tool
API Integrations	Node.js	OpenAI API, Perplexity API connectors
Containerization	Docker	Isolated, reproducible execution
Package Distribution	PyPI / GitHub Releases	Open-source tool distribution
Secrets Management	Environment variables + .env	No hardcoded credentials

Table 2: Backend tool infrastructure

Security & Privacy Architecture

Zero-Trust Principles

- Hardware-key-authenticated admin access (no password-only authentication)
- Cloudflare Zero Trust Access on all administrative endpoints
- Principle of least privilege enforced at all system layers
- No persistent server-side user data storage (static site architecture)

Privacy-by-Default Design

- No analytics tracking on public site (no Google Analytics, no fingerprinting, no session replay)
- Community-submitted data processed locally or encrypted E2E in transit
- Proton suite (Proton Mail, Proton Drive, Proton Calendar) for all organizational communications

- All vendor data handling governed by the Stonewall Standard DPA

Data Classification (Stonewall Standard)

Tier	Data Type	Handling Protocol
Tier 1	General public content	Open distribution
Tier 2	Organizational operational data	Encrypted at rest, access-controlled
Tier 3	Community sensitive data	Maximum protection, minimal collection

Table 3: Stonewall Standard data classification tiers

AI Integration Architecture

Secure Pride integrates AI capabilities responsibly with the following safeguards:

- **LLM Providers:** OpenAI API (GPT-4), Perplexity API (research assistant)
- **Training Data Opt-Out:** All API contracts include zero-retention clauses
- **Prompt Injection Safeguards:** Input sanitization layer before all LLM calls
- **Output Validation:** Structured output schemas (JSON mode) enforce response integrity
- **No PII to LLM:** Community-sensitive data is never passed to external AI endpoints
- **Audit Logging:** All AI-assisted outputs are logged with human review flags

Deployment & CI/CD Pipeline

Developer Push → GitHub Repository

↓

GitHub Actions CI (ESLint, Pytest, Bandit security scan, dependency

audit)

↓

Astro Build Process (static site generation)

↓

Cloudflare Pages Deployment (global edge nodes)

↓

Automated Checks (uptime monitoring, security headers verification, broken link scan)

Deployment Frequency: Continuous deployment on merge to main branch

Rollback Time: < 5 minutes via Cloudflare Pages versioning

Uptime Target: 99.9% (measured via UptimeRobot)

Compliance & Standards Alignment

Standard	Status	Evidence
WCAG 2.1 AA	In progress (docs + web)	Lighthouse accessibility audits
OWASP Top 10	Mitigated by architecture	WAF rules, CSP headers, input sanitization
NIST Cybersecurity Framework	Aligned (Identify, Protect, Detect, Respond)	Internal controls matrix
Stonewall Standard DPA	Authored and self-implementing	Public documentation
GDPR / CCPA	Compliant by minimal data collection	Privacy policy published

Table 4: Compliance and standards alignment

4. IMPACT FRAMEWORK & MEASUREMENT STRATEGY

Organizational Stage: Early Development

Secure Pride is in **active development and community building phase**. While we do not yet have large-scale user data to report, we have established a comprehensive measurement framework aligned with the CHAOSS open-source impact model and Common Good Cyber Fund reporting standards.

This section presents our **intended measurement strategy** and **performance benchmark targets** that will guide organizational growth and accountability.

Measurement Philosophy

We use a **dual-lens impact measurement approach** combining:

1. **Quantitative delivery metrics** (reach, usage, distribution)
2. **Qualitative community outcomes** (capacity built, threats mitigated, trust established)

This framework prioritizes **mission alignment over vanity metrics**. Our goal is not to maximize revenue or user count, but to serve the smallest, most under-resourced LGBTQ+ organizations effectively.

Tier 1 — Open-Source Development Metrics

As an open-source project, our code development activity is publicly verifiable in real-time at github.com/SecurePride and github.com/mazze93.

Metric	Data Source
Repository Stars	GitHub Insights
Total Commits	GitHub Insights
Active Contributors	GitHub Insights
Open Issues	GitHub Issue Tracker
Closed Issues	GitHub Issue Tracker
Forks	GitHub Insights
Releases Published	GitHub Releases
PyPI Downloads (future)	PyPI Stats API
Docker Hub Pulls (future)	Docker Hub API

Table 5: Open-source development metrics

Tier 2 — Product Engagement Benchmarks

The following benchmarks are drawn from the **Secure Pride Performance Framework**, which establishes tiered performance targets calibrated for early-stage nonprofit cybersecurity tools serving under-resourced communities.

Key Performance Indicators (Target State)

KPI	What It Measures	Baseline	Target	Thriving
Daily Active Users	Unique logins/day	50+	200+	500+
DAU / MAU Ratio	Product stickiness	15%	30%	45%
Weekly Active Orgs	Orgs active $\geq 1x/week$	40%	65%	80%
Time to First Value	Signup $\rightarrow$ first action	$\leq \$30$ min	$\leq \$15$ min	$\leq \$5$ min
Onboarding Completion	% new users completing setup	40%	70%	90%
Month-1 Retention	% users active after 30 days	50%	70%	85%
Support Ticket Resolution	Avg time to close ticket	$\leq \$48$ hrs	$\leq \$24$ hrs	$\leq \$4$ hrs
Accessibility Score (a11y)	WCAG 2.1 AA compliance %	80%	95%	100%
Orgs on Free/Subsidized Tier	% on mission-priced plans	30%	50%	65%

Table 6: Product engagement benchmarks (target performance)

Mission-Critical Metric: Time to First Value (TTFV)

Why This Matters:

For distracted, under-resourced teams (often volunteers or part-time staff), the window to demonstrate value is **under 15 minutes**. If a new user can't complete a meaningful security action (run first audit, complete policy checklist, resolve one alert) within that window, the tool will be abandoned.

Our Design Response:

- Guided onboarding with 3 steps maximum before first value delivery

- Plain-language tooltips at every decision point
- Pre-configured "quick scan" profiles (no configuration required)
- Instant visual feedback (progress bars, success confirmation screens)

Tier 3 — Security Outcome Metrics (Target State)

KPI	What It Measures	Baseline	Target
Security Tasks Completed/Org/Month	# actions taken per org	2	6
Incident Alert Response Rate	% alerts acknowledged \$<\$24hrs	40%	70%
Security Score Improvement	Avg score change over 90 days	+5 pts	+15 pts
Policy Template Adoption	% orgs using policy templates	20%	50%
Training Completion Rate	% users completing training	25%	60%

Table 7: Security outcome metrics (target performance)

Tier 4 — Qualitative Community Impact

As Secure Pride grows, we will gather **narrative evidence of community outcomes** through:

- Case studies of organizations conducting first-ever security audits
- Testimonials from volunteer coordinators and small nonprofit staff
- Documentation of threat incidents detected and mitigated
- Adoption stories of the Stonewall Standard DPA framework
- Community feedback via quarterly surveys (anonymized)

Theory of Change

Data Collection Methods

Method	Tool	Frequency	Privacy Safeguards
Repository analytics	GitHub Insights	Monthly	Public data only
Web traffic	Cloudflare Analytics	Monthly	No PII, no fingerprinting
Tool usage logs	Audit suite telemetry	Per-session	Opt-in, anonymized
Community surveys	Typeform (encrypted)	Quarterly	Anonymized responses
Partner testimonials	Direct outreach	Bi-annual	Consent-based

Table 8: Data collection methods and privacy safeguards

Accountability & Transparency Commitment

Secure Pride commits to **annual public reporting** of impact metrics, including:

- Community impact summary (organizations served, tools deployed, threats mitigated)

- Mission alignment report (percentage of users on free/subsidized tiers, median org size served)
- Financial transparency (revenue sources, expense breakdown, API costs)
- Open-source contribution metrics (commits, contributors, community engagement)

As an open-source nonprofit, we hold ourselves accountable to the communities we serve through radical transparency.

5. TEAM QUALIFICATIONS

Organizational Overview

Secure Pride is led by a small, mission-aligned founding team combining hands-on cybersecurity engineering expertise with archival, research, and organizational management experience. The organization prioritizes **LGBTQ+ leadership at every level** of decision-making.

Principal Investigator / Executive Director

Mazze LeCzzare Frazer

Founder & Security Engineer | Durham, North Carolina

Contact: hello@securepride.org | +1 919-667-6994

Educational Background

University of California, Davis

Regents Scholar

Research positions held:

- **UC Davis Center for Mind and Brain** — Research assistant in the Luck Lab under Steven J. Luck, Ph.D. (cognitive neuroscience, electrophysiology)
- **California National Primate Research Center (CNPRC)** — Lab Manager and Junior Specialist (research operations, animal welfare protocols, compliance)

- **Cognitive Electrophysiology and Neuroimaging (CEAN) Laboratory** — Research assistant under John M. Olichney, M.D., Professor of Neurology, UC Davis School of Medicine (EEG/ERP research, clinical neuroscience)

Relevant Professional Expertise

Cybersecurity & Privacy Infrastructure

Design and implementation of zero-trust architectures, DNS hardening, TLS/SSL security, secrets management, OWASP-aligned web application security, and incident response planning.

Open-Source Development

Active maintainer of security tooling under github.com/mazze93 and github.com/Secure-Pride. Fluent in Python, JavaScript/TypeScript, Bash/Zsh, and AppleScript. Experience with full-stack frameworks (Astro, React, Node.js) and cloud-native deployment (Cloudflare Pages, GitHub Actions CI/CD).

AI Integration & Safety

Practical experience integrating OpenAI and Perplexity APIs with privacy safeguards. Focus areas: prompt injection prevention, LLM output integrity verification, AI-assisted threat detection, and responsible use of generative AI in civil society contexts.

Accessibility-First Design (Neurodivergent-Centered)

All Secure Pride products are designed with ADHD and neurodivergent users as the primary audience. Design methodology includes:

- Reduced cognitive load (progressive disclosure, plain language, visual hierarchy)
- ADHD-friendly interfaces (clear CTAs, distraction-free layouts, batch notifications)
- Screen-reader compatibility (WCAG 2.1 AA compliance, semantic HTML, ARIA labels)
- Multi-modal learning (video tutorials, text guides, interactive walkthroughs)

Technical Writing & Documentation

6+ years of content strategy and technical documentation experience

across cybersecurity, research, and developer tooling. Author of the **Stonewall Standard Data Processing Agreement** framework.

Research Methodology

Systematic research training from UC Davis (Center for Mind and Brain, CNPRC, CEAN Lab) applied to security threat modeling, vulnerability assessment, and community-centered design research.

Organizational Role

As Executive Director and Principal Investigator, Mazze leads all technical development, grant research, strategic planning, and program delivery for Secure Pride. They are the primary contributor to all open-source repositories and the lead author of organizational governance documentation.

Co-Investigator / Primary Secretary

Alec Phillips

Archival Records Specialist | Research Triangle International (RTI)

Background

Alec Phillips is an Archival Records Specialist at **Research Triangle International (RTI)**, one of the world's leading independent nonprofit research institutions headquartered in the Research Triangle region of North Carolina. His professional expertise centers on records management, information governance, and the preservation and accessibility of institutional documentation.

Relevant Professional Expertise

Archival Science & Records Management

Professional experience managing complex document lifecycles, access controls, retention schedules, and long-term preservation strategies at a major research institution.

Information Governance

Deep familiarity with data handling policies, regulatory compliance documentation, and institutional governance frameworks in research and nonprofit contexts.

Organizational Administration

Experienced in the administrative infrastructure of nonprofit and research organizations, including regulatory filings, grant documentation, and stakeholder communications.

Research Institution Standards

RTI affiliation provides direct experience with the operational and documentation standards expected by major foundations, federal grant programs (NIH, NSF, USAID), and institutional review boards.

Organizational Role

As Primary Secretary and Co-Investigator, Alec supports Secure Pride's administrative infrastructure, organizational records management, and documentation governance. His archival expertise ensures that grant records, program documentation, and compliance materials meet the standards of institutional funders.

Organizational Affiliations & Partnerships

Entity	Nature of Relationship
Research Triangle International (RTI)	Team member affiliation (Co-I employer)
UC Davis (CMB, CNPRC, CEAN)	PI alumni research institution
GitHub (Secure-Pride organization)	Primary open-source distribution platform
Cloudflare	Infrastructure partner (CDN, security, Zero Trust)
Proton	Secure communications provider

Table 9: Organizational affiliations and partnerships

Relevant Prior Work

- **OpenAI Researcher Access Program Application (2025)** — Submitted research proposal for AI-native threat detection for civil society organizations; developed comprehensive supporting documentation package
 - **Stonewall Standard DPA v1.0** — Authored and published open-access data governance framework for LGBTQ+ nonprofit data handling
 - **Cyber-Defense Audit Suite** — Developed and actively maintaining open-source security assessment tooling designed for under-resourced nonprofit operators
 - **AI Threat Toolkit (in development)** — Building toolkit addressing LLM-specific threat vectors targeting civil society organizations (target release: Q2 2026)
-

Diversity & Representation Statement

Secure Pride is **LGBTQ+-led** and explicitly centers the security needs of communities that are historically underserved by mainstream cybersecurity programs. The founding team brings **lived experience as members of the communities we serve**, ensuring our tools, frameworks, and training materials are developed with authentic understanding of the threat landscape our users navigate.

We recognize that **security is not neutral** — marginalized communities face disproportionate surveillance, harassment, and violence both online and offline. Our design process, threat modeling, and governance frameworks are informed by this reality.

6. DESIGN PHILOSOPHY: MINDFUL DEVELOPMENT

What is Mindful Development?

Mindful Development is Secure Pride's core design and engineering philosophy. It emphasizes **execution excellence without sacrificing authenticity and creativity**. The practice is rooted in three interconnected principles:

1. Clarity Over Cleverness

- Write code and documentation that future-you (and collaborators) can understand without cognitive strain
- Prefer explicit, readable patterns over terse, "clever" solutions
- Use plain language in user-facing text — no jargon, no gatekeeping

2. Modularity as Compassion

- Break complex systems into small, testable, understandable units
- Modular design reduces the cognitive load required to contribute, debug, or extend functionality
- Each module should do one thing well and be documentable in under 10 minutes

3. ADHD-Friendly Design Patterns

- **Progressive disclosure:** Show only what's needed now; hide complexity until relevant
 - **Visual hierarchy:** Use whitespace, color, and typography to guide attention
 - **Batch notifications:** Avoid alert fatigue by grouping low-priority updates
 - **Undo/redo everywhere:** Reduce fear of mistakes; make experimentation safe
 - **Plain-language error messages:** Explain what happened, why, and what to do next
-

Accessibility as Default (Not an Afterthought)

Every Secure Pride product is designed **accessibility-first** from initial wireframes through production deployment. This is not a compliance checkbox — it is a **design constraint that produces better products for everyone**.

Neurodivergent-Centered Design

- **ADHD:** Reduced visual clutter, clear CTAs, distraction-free modes, batch notifications
- **Dyslexia:** Increased line spacing, sans-serif fonts, left-aligned text, no justified text
- **Autism:** Predictable navigation patterns, explicit state indicators, no surprise modals
- **Anxiety:** Undo buttons everywhere, confirmation dialogs for destructive actions, progress indicators

Universal Design Benefits

When we design for neurodivergent users, **everyone benefits**:

- Clearer interfaces reduce training time for all users
- Plain-language documentation improves comprehension across education levels
- Keyboard-navigable UIs serve power users, accessibility tool users, and mobile users alike

Open-Source as Accountability

By publishing all code, frameworks, and governance documentation openly, Secure Pride subjects itself to **continuous peer review** from the global security community. This transparency:

- Builds trust with community organizations wary of proprietary "black box" security tools
- Enables rapid improvement through community contributions and bug reports

- Ensures longevity — even if Secure Pride ceased operations, the tools would remain available

We operate under the principle that **community safety infrastructure should be a public good**, not a profit center.

CONCLUSION

This supporting materials package provides grant reviewers with comprehensive evidence of Secure Pride's:

- **Technical capabilities** (open-source portfolio, architecture, deployment practices)
- **Impact measurement strategy** (tiered benchmarks, community outcomes, accountability framework)
- **Team qualifications** (research backgrounds, cybersecurity expertise, lived experience)
- **Design philosophy** (accessibility-first, neurodivergent-centered, Mindful Development)

We are committed to building cybersecurity infrastructure that is **accessible, trustworthy, and community-owned**. Our work is transparent, our code is public, and our mission is clear: **make safety possible for the communities that need it most**.

As an early-stage organization, we recognize that our impact is measured not only in metrics, but in the trust we build with the communities we serve. Grant funding will accelerate our ability to deliver tools, training, and frameworks that make LGBTQ+ organizations materially safer.
